

# Scancommander

19" unit

Art.-No. 120101

Even in the late 80s multifunctional consoles were used for the premier touring and theatre business. Today they are also used for many small productions. The original idea of controlling multifunctional equipment via a common lighting control desk quickly became absolutely essential: the complexity of these moving lights required a completely new and independent operating logic.

Here the MA scancommander set new standards. Today its basic operating philosophy combined with the comfortable programming with a maximum of flexibility is found in nearly every Moving Light-Controller. After its introduction into the market in 1992 even today the Scancommander is still offering real solutions for demands that might occur with the control of multifunctional equipment.

The Scancommander Extension upgrades the Scancommander with another 16 multifunctional fixtures including 24 functions each. The setup connection is made via a user-friendly menu built into the unit. With a MIDI cable the Scancommander is connected with the extension and can be used in the Master-Slave mode. Now the Extension shows all fixtures no. 17-32, that can be selected. Alternatively you can work with the Extension by remote control via DMX, analogue or SMPTE.
